Video Presentations for the Internet

- Why should Video (and Audio) files be uploaded?
 - Ease of access
 - Save printing and duplicating costs
 - Reaching a broader audience
 - Make a point
 - Be inclusive

What is Streaming Video?

- Wikipedia is a great source of information.
 - http://en.wikipedia.org/wiki/Streaming_media
- Costly, requiring special equipment, large amounts of storage space, and a provider of streaming video services
- Many people do not have the upgraded equipment that is required to play it effectively on their computers
- Non-streaming video remains the primary delivery method

What is Progressive Video?

- Wikipedia to the rescue again!
- http://en.wikipedia.org/wiki/Progressive_download
- This method stores pieces (chunks) of the video on the viewers computer in temporary files which are then played, in the proper sequence, on the computer.
- The rate of playback by the receiving computer can exceed the download rate and cause some starts and stops on slower systems. In such cases, the video will restart once the next packet has completed its download.
